

*This rubric explains how the quality of a student’s Assignment 3 submission is evaluated.
For each criterion, markers select one level that best reflects the overall quality of submission and award a mark within the indicated range.*

	Criteria	Developing	Nailing it	Solid work	Exceptional quality
SIT215 Assignment 3: Integrated intelligent system project – Rubric	Integrated system design and modelling alignment (8)	- The problem goal or overall integrated system design is unclear, incomplete, or only partly connected to the task. - The fuzzy inference system, search, and replanning components are weakly connected, with limited evidence of a coherent hybrid approach. (1-2)	- The problem goal and overall integrated system design are clear, and the approach is generally suitable for the task. - The fuzzy inference system, search, and replanning components are connected at a basic level, though the hybrid reasoning may still be uneven or only partly justified. (3-4)	- The integrated system is clearly designed and well matched to the problem, with a sensible and coherent hybrid approach. - The fuzzy inference system, search, and replanning components work together well, and the reasoning behind the integration is mostly clear and appropriate. (5-6)	- The integrated system is designed very clearly and is strongly matched to the problem goal, with thoughtful and effective modelling choices. - The hybrid reasoning system is highly coherent, well justified, and shows strong understanding of how fuzzy logic, search, and replanning support intelligent system behaviour. (7-8)
	Implementation quality, competency, and comparison (12)	- Shows an initial attempt to implement the planner, fuzzy inference, and replanning components, but some parts are incomplete, unclear, or not yet working together consistently. - Testing and comparison are limited or only partly aligned with the problem context, and there is only basic use of evidence to explain intelligent system behaviour. - The hybrid reasoning planner, heuristic, or constrained problem handling is introduced, but the implementation detail or technical connection across components is still developing. (1-3)	- Provides a mostly functional implementation of the planner, fuzzy inference, and replanning components, with a generally sound technical structure.. - Testing and comparison use relevant cases and some supporting evidence, though the depth of analysis or detail may still be uneven. - The hybrid reasoning planner and heuristic are implemented in a way that is generally suitable for the problem, even if some parts would benefit from stronger refinement or clearer linkage. (4-6)	- Provides a functional and well-structured implementation of the planner, fuzzy inference system, and adaptive replanning components. - Testing and comparison are aligned with the problem context and constrained cases, with clear use of data to support performance discussion. - The hybrid reasoning planner and heuristic are implemented appropriately, showing good technical connection across the main components of the system. (7-9)	- Provides a highly coherent, technically strong, and robust implementation across planning, fuzzy inference, hybrid integration, and adaptive replanning. - Testing and comparison are well presented and analysed, strongly aligned with the problem and constrained conditions, and supported by clear and meaningful evidence and evaluation results. - The hybrid reasoning planner and heuristic are implemented with excellent judgement, showing strong technical quality and very effective integration across the full system. (10-12)
	Application of theoretical concepts (8)	- Theoretical explanations are unclear or partially inaccurate. - The connection between theory and the implemented system is emerging, though some ideas are only loosely linked to the problem context or constrained conditions.. - Admissibility, adaptive replanning, or hybrid system reasoning may be mentioned, but the justification is still basic and would benefit from stronger concept demonstration. (1-3)	- Clearly explains and applies relevant theoretical concepts. - Heuristic design, cost evaluation, fuzzy inference, and replanning are mostly aligned with the task, though the justification may still be somewhat general. - The connection between fuzzy inference, adaptive replanning, and search in the hybrid system is addressed, with reasonable explanation of how the main concepts support the solution. (4-6)	- Provides a detailed and accurate application of theoretical concepts. - The chosen heuristic and cost design are well justified in relation to the problem goal, constrained problem setting, and integrated system behaviour. - The connection between fuzzy inference and search is explained well, showing sound understanding of admissibility and hybrid system reasoning. (7-9)	- Demonstrates advanced critical thinking by extending beyond standard theoretical concepts. - Heuristic design, cost evaluation, fuzzy inference, and adaptive replanning are justified with strong depth and excellent alignment to the task context. - The hybrid system reasoning is explained with high clarity, showing excellent understanding of admissibility, constraint handling, and how inference supports intelligent replanning behaviour. (10-12)
	Reasoning, presentation, and communication (12)	- The submission communicates some key ideas, but parts of the report or video are unclear, loosely structured, or only partly focused on the required task points. - Explanations across the report, code annotations, visuals, flowchart, or video are still developing, with limited detail or uneven alignment across the submission. (1-2)	- The submission communicates the main ideas of the work clearly in the report and video, with an overall structure that is generally easy to follow. - Explanations, visuals, code references, flowchart, and video are used appropriately, though some parts may be brief, uneven, or not fully connected. (3-4)	- The submission communicates the problem, integrated system, and outcomes clearly through a well-structured report and video. - Explanations are supported by relevant code references, visuals, flowchart, and video content, with good alignment across the submission. (5-6)	- Demonstrates outstanding presentation quality meeting professional standards. The submission communicates the work very clearly, professionally, and with strong focus on the required task criteria across the report and video. - Explanations are precise, well supported by high quality visuals and code-aligned evidence, and make the integrated system and its reasoning easy to understand. (7-8)
